

RIPE 59 update

The first days : Pheon-Ix

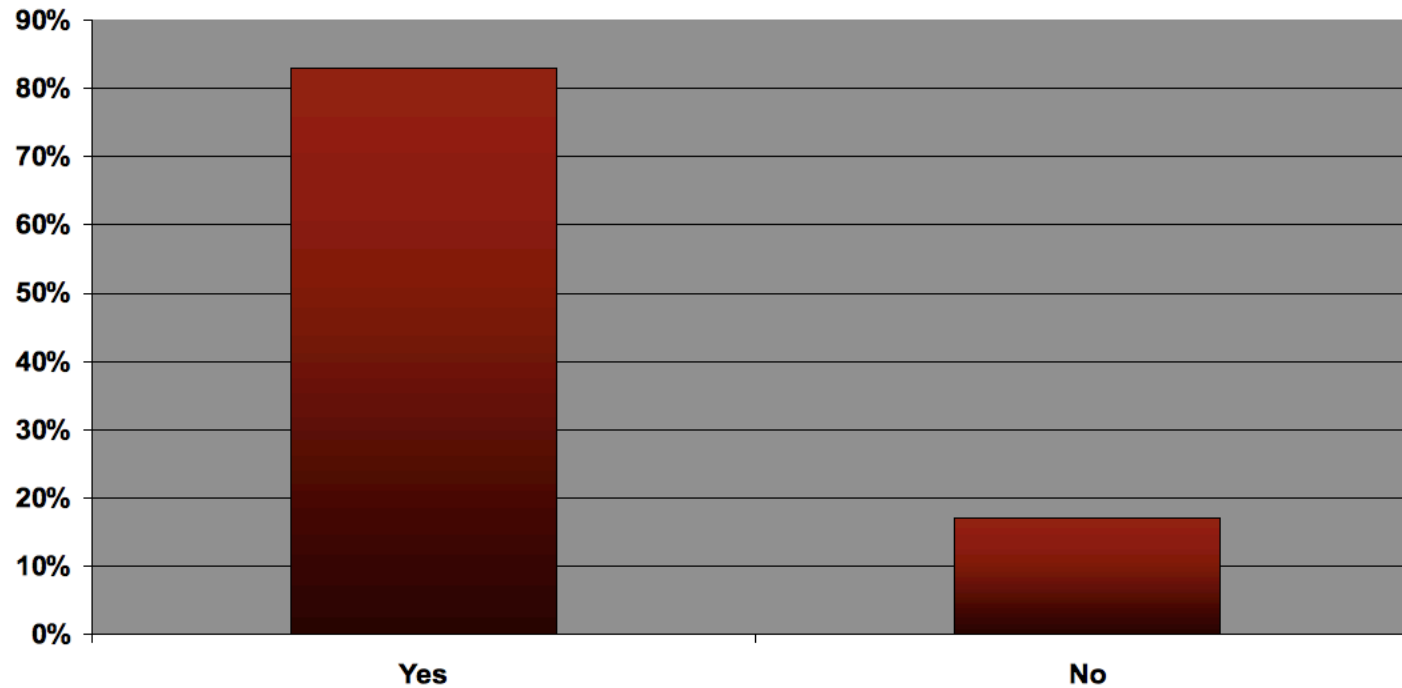

- We are a group a individual from different companies with the same goal
- Pheon-Ix working group created by Maurice Dean (Google) , Christian Kaufmann (Akamai), Nicolas Strina (Jaguar Network), Raphael Maunier (Neotelecoms)
- We started to talk to the existing peering point in Paris
- We made a survey with more than 70 answers
- We needed help from the « outside »
- We decided to move with companies not individual anymore

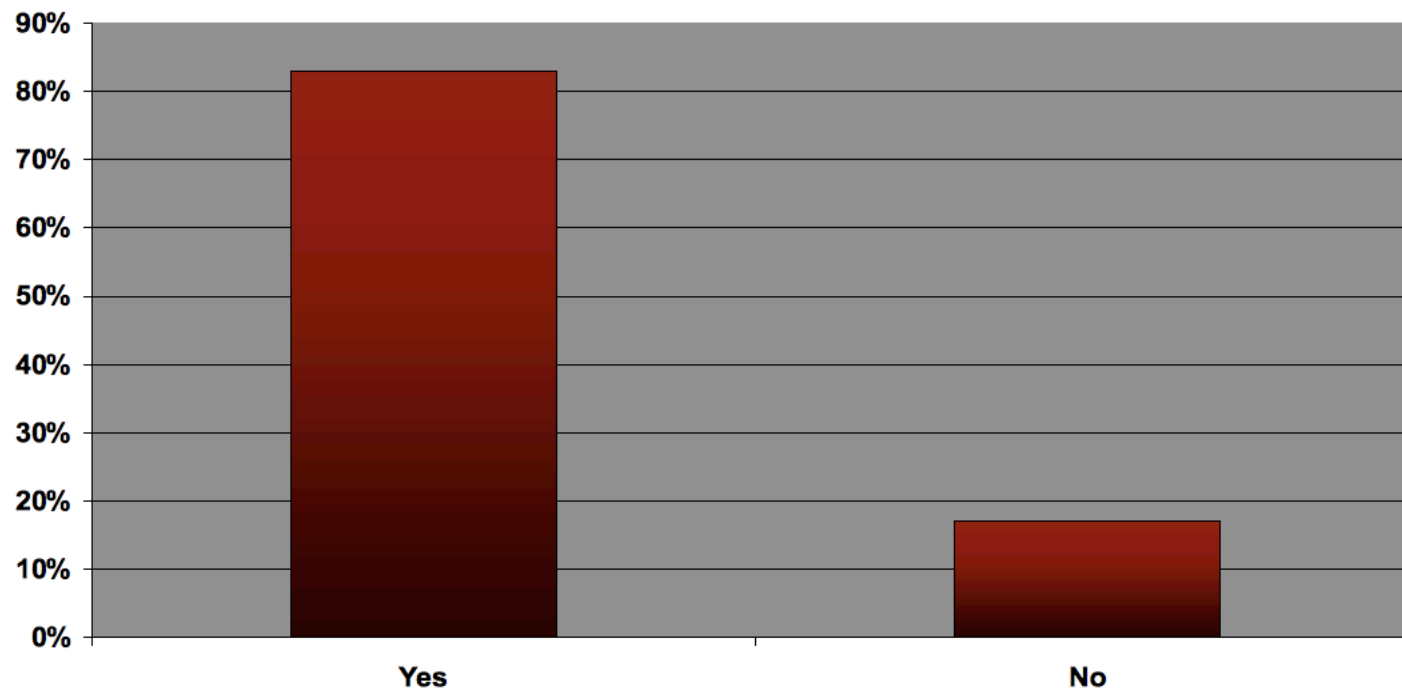

Do you think it is the right approach to consolidate existing exchange infrastructure?

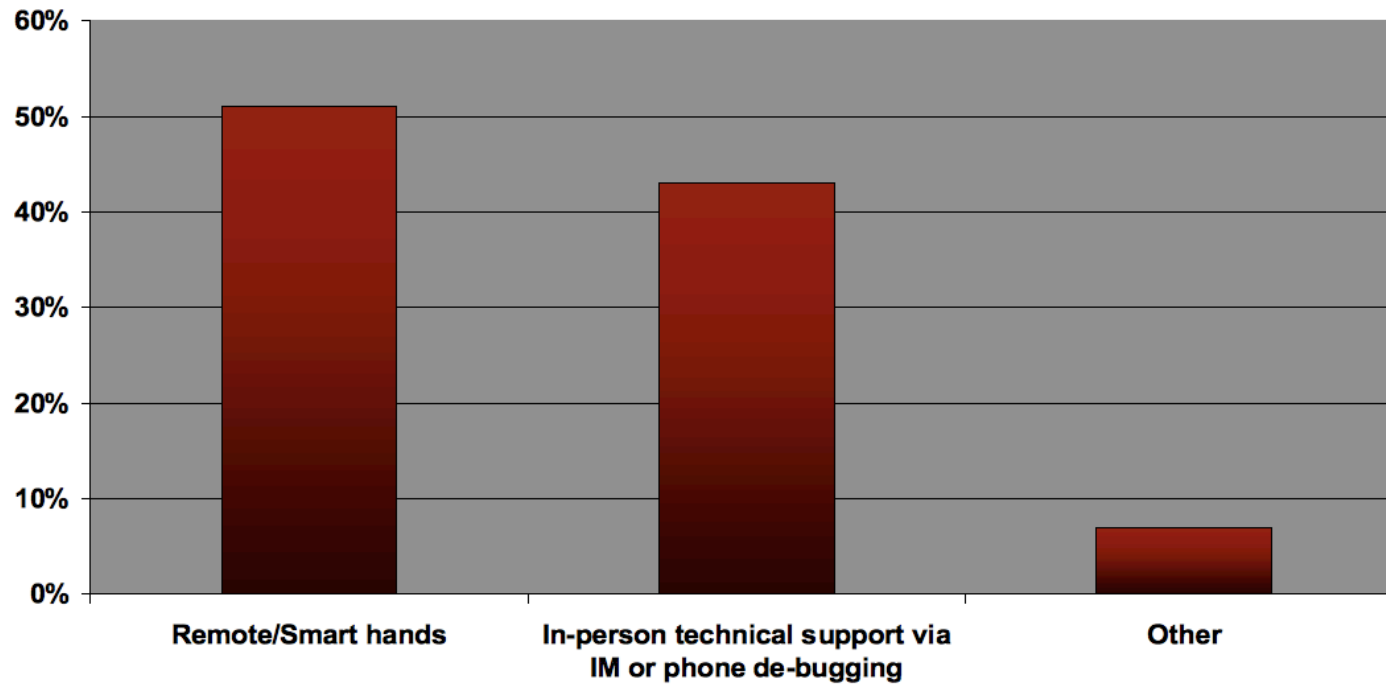

Are you prepared to pay a market rate for your port?

Is a support organisation required for the exchange point?

24/7/365 operations team

Which organisation today ?

- The initial working group has federated companies to support the project : Google, Akamai, Jaguar Network, Neo Telecoms and Interxion
- Working group name changed to France-IX
- A legal status has been chosen : Groupement d'Intérêt Economique (GIE) (Economic Interest Group, abbreviated EIG)
- This status for the French law means an organisation owned by its variable quantity of members, but considered as a company for legal and fiscal issues

What is the status today ?

- First POPs are defined
- We have the support from the main neutral carrier hotels for the colo space
- We already have hardware : Force 10
- We already have the fiber network between carrier hotels
- We also have budgets for marketing and staff

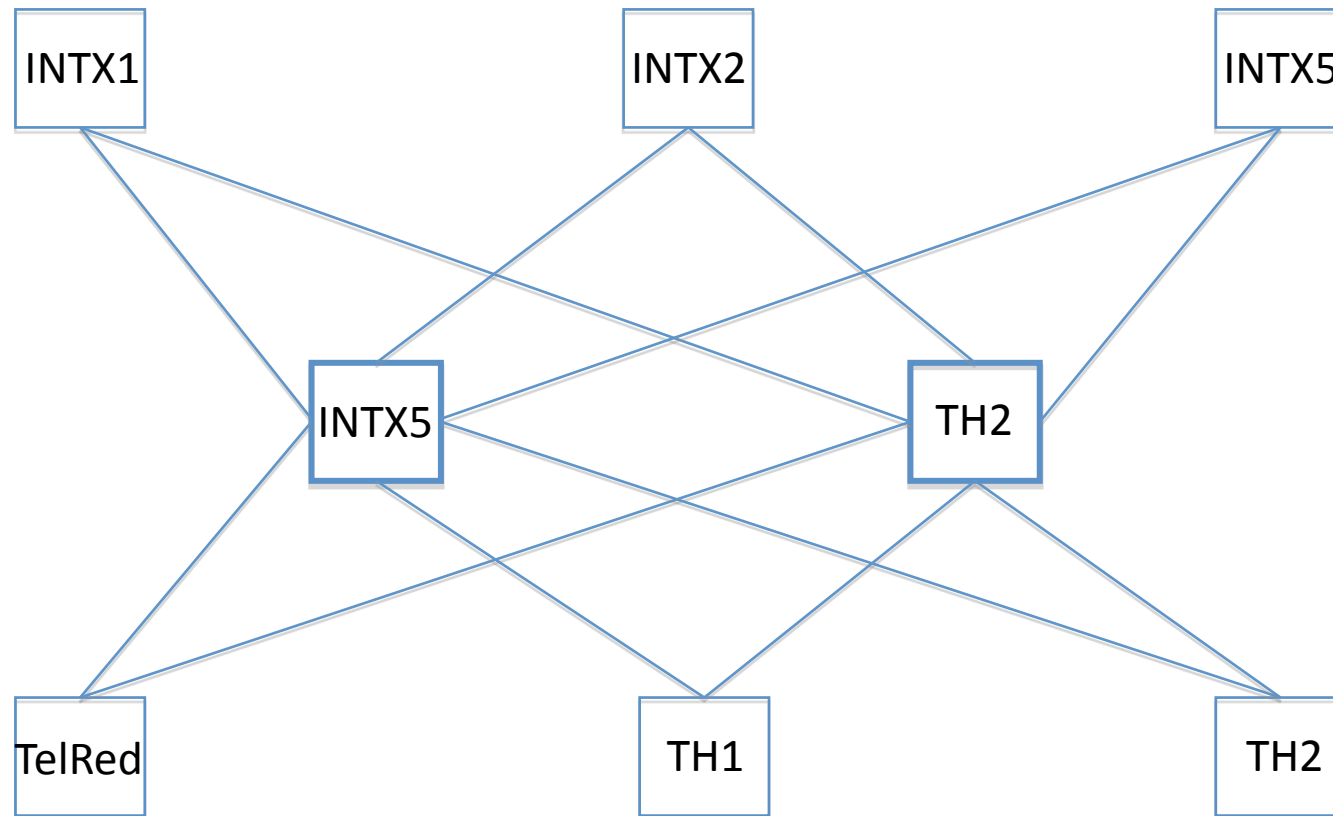

What are the next steps ?

- Deployment of first POPs in the coming weeks
- Migration or connection of peers already present in the POPs
- Official launch in December
- Communication and marketing to other parties about the peering point (foreign telcos, etc..)
- Extension to new POPs in Paris
- Discussions with other peering points in Paris to federate them around FranceIX
- Apply to be a Euro-IX Member

Phase 1

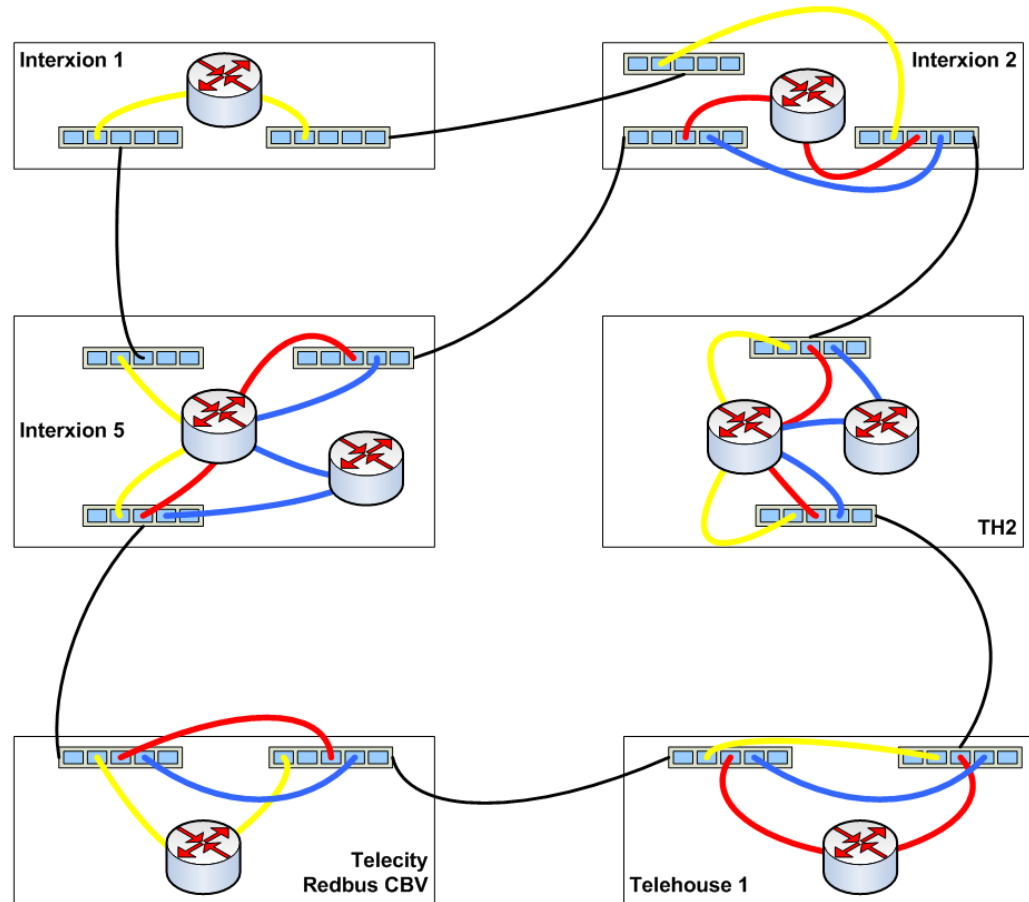

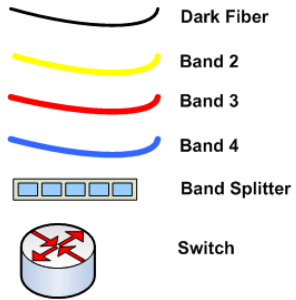

1. With one ExaScale chassis per core site

— N x 10GE

Fibers and WDM configuration
