

Introduction of optional mnt-ref and ref-nfy attributes for person/role objects

Piotr Strzyżewski

Silesian University of Technology, Computer Centre

Reason

- ❑ Lack of authorization during person/role reference process could lead to abuse of these objects.
- ❑ There are various reasons for such behavior:
 - lazy customer reference upstream's contacts,
 - nasty person reference some objects to mislead users who are looking for abuse contact.

Proposal

- „mnt-ref” optional attribute could be added to person and role objects to prevent such problems (authorization)
- „ref-nfy” optional attribute could be added to person and role object to enable notification mechanism

Pros and cons

- (+) Re-using an existing mechanism
- (+) Increased security

- (-) Some work needs to be done ;-)
